

Sire and Dam Summary / APRIL 2015

Wagyu Breeding Guide

Build your Herd with Confidence

Welcome to our first Wagyu Breeding Guide

We are delighted to present the Australian Wagyu Association's first Wagyu Breeding Guide.

This 2015 First Edition will assist Wagyu breeders to better understand the wide range of Wagyu Fullblood sires and dams used in Australia and their performance capabilities. Both Black and Red Wagyu are included. All rankings are based on the new Wagyu EBVs and Fullblood Terminal Index using abattoir carcass results.

A key goal of our R&D program has been to identify new Australian bred sires with higher performance than their forebears. I am delighted to see these sires emerging in this Breeding Guide as they form the foundation for genetic improvement.

The results supporting the positions of some sires in the Australian national Wagyu herd now have extensive carcass data support and so high EBV accuracy.

Others will increase their accuracy and may change their ranking as more data is added and we urge all producers, feeders and processors to contribute.

The Wagyu Collaborative Genetics Research Project has provided the carcass data used in this analysis. Our thanks to Meat & Livestock Australia for its joint funding, to AGBU and ABRI for their outstanding scientific contribution, and to all supporting data contributors who have so generously shared their herd information.

We look forward to your feedback on this first Wagyu Breeding Guide as we believe it will add real value to your Wagyu beef business.

Warmest regards,

[Scott de Bruin](#) - President
[Australian Wagyu Association / April 2015](#)

INTRODUCING The Wagyu Breeding Guide

Sire and dam selection is a key decision for all Wagyu breeders, but it can also be complex.

This Breeding Guide will help simplify the selection process for you. It provides a listing of bulls and females from Australia with substantial carcass data recorded. Estimated Breeding Values (EBVs) are used to organise bulls by the most common breeding objectives. Wagyu breeders can select bulls and dams from the Wagyu Breeding Guide with confidence that the information is independent and backed by strong science from the Animal Genetics & Breeding Unit (AGBU) and the Agricultural Business Research Institute (ABRI), based at the University of New England, Armidale, NSW.

All tables also include each bull and/or dam's Fullblood Terminal Index (FTI), developed specifically for Wagyu by AGBU to compare the animal's genetic contribution to their individual slaughter progeny's commercial value. The FTI formula reflects the value Wagyu breeders place on carcass weight and marbling. Leading bulls that make the Breeding Guide rank highly for slaughter progeny profitability. For feeder producers, 200 and 400 Day Weight EBVs can help in identify early growth that might be employed to enhance returns.

Future Indexes will provide a more holistic self-replacing herd outcome including traits such as fertility and maternal capabilities. A Feeder Producer Profitability listing is also under discussion.

This Guide enables you to apply your own priorities and select appropriate sire and dam breeding for your herd. Where your selection of seedstock genetics is unavailable for purchase, a review of pedigrees will provide a direction for alternative

selection. An AI Sire listing on Page 33 identifies those bulls in the Breeding Guide with semen available.

> What's most important to you?

Using this guide with the accompanying new EBVs is simple. First, identify your highest breeding priority, such as:

- Improving early growth for feeder sale profit
- Boosting marbling;
- Improving carcass weight;
- Selecting the most reliable proven bulls; or
- Maximising slaughter progeny returns.

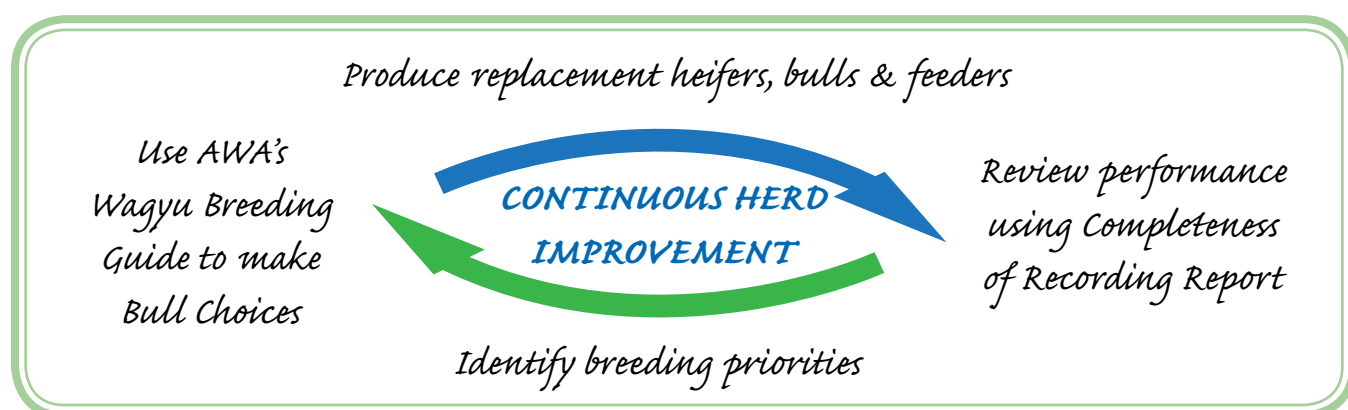

Go to the Growth EBVs or Table that meet your highest breeding objective and select with confidence.

An electronic, sortable version of the Breeding Guide sire and dam lists are available on www.wagyu.org.au – Breeding Wagyu. For full access to all new Wagyu EBVs and the Fullblood Terminal Index covering the entire Australian Wagyu Association recorded animal population, go to www.wagyu.org.au - Animal Search - EBV Enquiry.

> Monitoring your herd's genetic progress

The Wagyu BREEDPLAN Completeness of Recording Report uses EBVs and Indexes produced from data collected through your herd recording to let you track the genetic progress of your herd on key traits. With the Completeness of Recording Report you can monitor the success of your breeding choices and benchmark your herd against the national Wagyu herd.

This Report is available to all Wagyu BREEDPLAN enrolled members. Contact our Technical Officer, Alex McDonald on 02 6773 2472 or mobile 0412 811 123 email: alex@sbts.une.edu.au to get a report for your herd.

Advances in Wagyu Breeding Technology

With the rapid growth in demand for elite Wagyu beef in Australia

and globally, production is expanding rapidly, with major opportunities available for producers and processors. Well described, high performing Wagyu genetics are in high demand. In response, Australian Wagyu seedstock registrations doubled in 2013 and increased a further 14% to 6764 in 2014. All fullblood seedstock animals are DNA parent verified to ensure accurate pedigree.

The Australian Wagyu Association has used world renowned BREEDPLAN genetic analysis technology since 1992, producing Estimated Breeding Values (EBVs) to describe the economically important traits in Wagyu production, including fertility, maternal, growth and carcass (see 'What Do The Numbers Mean?' on page 8)

Further improvement in the Wagyu BREEDPLAN technology has been undertaken over the past two years through a Wagyu Collaborative Genetics Research Project. With joint funding from Meat and Livestock Australia, Stage 1 of the project was conducted with the following aims:

- To collect carcass and genotype data on 2-3000 Wagyu fullblood and crossbred animals slaughtered at commercial abattoirs including data collected using the Japanese Digital Camera
- To calculate the heritability of the traits measured including the Camera Image Analysis traits and the genetic relationships with Australian industry-standard assessments such as the AUS-MEAT Marbling Score.
- If the traits are heritable and have economic value to investigate the calculation of Estimated Breeding Values for those traits and possible new Indexes for the Wagyu breed.
- To investigate whether genomic data can be used to estimate genomic relationships to provide or augment pedigree data on these animals

> Stage 1 Outcomes:

- Carcass data including carcass weight, AUS-MEAT marbling score, P8 rump fat depth, and up to 11 Camera Marbling traits was collected on 2215 carcasses.
- The data was analysed by the Animal Genetics and Breeding Unit (AGBU) with heritabilities and genetic correlations between traits calculated.
- The heritability of key traits was generally high such as carcass weight (0.47), AUS-MEAT Marble Score (0.52), Camera Marbling Percentage (0.35), Camera Fineness Index (0.50) and Camera Eye Muscle Area (0.62).
- The genetic correlation between the marbling traits was high.
- All carcass weight, P8 fat and Rib Eye Area Measurements are now incorporated in the standard Wagyu analysis increasing the accuracy of the EBVs for these traits.
- New EBVs for Marble Score, Camera Marbling Percentage and Camera Fineness Index are now calculated by the Animal Genetics and Breeding Unit in a multi-trait model
- Two of these EBVs, Marbling Score and Marbling Fineness are published for all animals in the analysis. The EBV for Camera Marbling Percentage (CCMP) is not published but contributes to the Marble Score EBV. The current AUS-MEAT marble score assessment is unable to measure the highest levels of fullblood Wagyu marbling, these CCMP adjustments are the first step to overcoming this difficulty.
- A new Wagyu Feedlot Terminal Index is calculated for animals in the new analysis, utilising the Marble Score and Carcass Weight EBVs, producing indexes for 570 Fullblood sires and 3,178 Fullblood females.

These new EBVs and Index were first released in March 2015 enabling more accurate identification, selection and use of high performance Wagyu genetics, and providing a foundation for increased genetic gain. Data collection is ongoing and EBVs and the new index are updated monthly and reported on the AWA website. Inevitably, ranking changes reflect progress in those herds contributing data. Future balance across the Australian Wagyu national herd can only be achieved by contributions especially of carcase data from Wagyu breeders.

Stage 2 will develop genomic tests from DNA samples to increase the accuracy of EBVs for young sires and heifers. It is also hoped that this same technology will be used for tests to predict commercial feedlot profitability of

commercial Wagyu animals, increasing the efficiency of feeding regimes.

Such powerful genetic tools will allow Wagyu breeders to make genetic improvements in their herds. Wagyu sires and dams demonstrating high performance will rapidly increase in value as a direct result of their proven value to the supply chain.

Contributing Members

A total of 30 members have generously contributed AUS-MEAT carcase and/or Digital Carcase Camera plus associated live weights for inclusion in the new Wagyu Genetic Analysis, with a substantial portion contributed by AACo:

Herd	AUS-MEAT data	Camera Marbling data
Duo Enterprises	66	60
Edgefern Wagyu	17	8
Falls & Sons	16	4
Fung	32	32
Ginjo Wagyu	53	50
Greenhills Wagyu	166	139
Island Wagyu	64	0
Irongate Wagyu	15	0
Kalanga Wagyu	40	25
Kinto	83	79
Kuro Kin Wagyu	116	57
Leichhardt Wagyu	60	0

The Sire and Dam Lists

The sires and dams listed in the Breeding Guide have been selected based on the following criteria:

1. Minimum accuracy of 50% for Marble Score EBV
2. Minimum accuracy of 50% for Carcase Weight EBV
3. Minimum 5 carcase progeny for sires
4. Minimum 1 carcase progeny for dams

Individual Wagyu sires and dams listed on the AWA website database may have higher Fullblood Terminal Index values, but are not included in this Breeding Guide due to EBVs with accuracies of less than 50%, or fewer than the minimum carcase progeny required for publication in this Breeding Guide.

Influence of Differing Australian Production Systems

Unlike mainstream Japanese Wagyu production, where Days on Feed (DOF) and Days of Age (DOA) at slaughter are nationally consistent, Australian Wagyu DOF systems vary from organic grassfed, to paddock-

supplemented, to relatively short-fed, and then to full Japanese-equivalent regimes, with numerous intermediate variations, and with similarly varying ages (DOA) at harvest.

While AWA recognises there are worthwhile DOF/DOA 'targets' for improved production efficiency, these 'First Edition' Wagyu EBVs and Index are not based on any specific production system, to enable published individual animal values to reflect as close to a 'level playing field' as possible.

What Do The Numbers Mean?

Australian Wagyu Genetic Analysis

The Australian Wagyu BREEDPLAN analysis provides the most thorough and accurate assessment of the Wagyu genetics available outside of Japan. The analysis includes 19,837 calves that have at least a weaning (200 day) weight recorded. There are 15,922 animals with birth weights and 16,518 with 400 day weights. Carcase data includes 3,863 carcase weights, 2,514 carcase EMA, 3,907 carcase AUS-MEAT marble scores, 2,273 camera marbling percent measures and 1,950 camera fineness index measures. The analysis includes 44,575 dams and 4,327 sires.

While this comprehensive dataset provide a good profile of Australian Wagyu genetics, more data will increase

the power of this analysis. The Australian Wagyu Association stresses that data contribution represents a valuable herd improvement opportunity available to all members, who may join Wagyu BREEDPLAN at any time. Ensure your genetics are represented - contribute your data.

Estimated Breeding Values (EBVs)

Estimated Breeding Value is the estimated genetic merit of an animal for each recorded production trait. EBVs reflect the difference that can be expected in an animal's performance relative to the breed baseline for each trait. On average, half of this difference will be passed on to the animal's progeny.

Japanese Digital Image Camera

Accuracy

An accuracy value is presented with every EBV and gives an indication of the amount of information that has been used in the calculation of that EBV. The higher the accuracy the lower the likelihood of change in the animal's EBV as more information is analysed for that animal or its relatives.

Accuracy Range Interpretation

LESS THAN 50% = Low accuracy and should be considered a preliminary estimate. The EBV could change substantially as more performance information becomes available.

50 - 74% = Medium accuracy, usually based on the animal's own records and pedigree.

75 - 90% = Medium-high accuracy and usually includes some progeny information. Becoming a more reliable indicator of the animal's value as a parent.

90% AND ABOVE = High accuracy. It is unlikely that the EBV will change much with the addition of more progeny data.

Carcase EBVs and Index

The following EBVs and Fullblood Terminal Index are provided in this Breeding Guide due to the high priority placed on carcase traits in the Wagyu breed.

Carcase Weight EBV (kg) estimates the genetic difference in a standard AUS-MEAT carcase weight at an age of 750 days. This is an AGBU adjusted Days of Age value that allows animals to be compared on a "level playing field". More positive EBVs indicate heavier carcasses at a given age.

Eye Muscle Area EBV (cm²) estimates genetic differences in eye muscle area at the 12/13th rib site of a 400kg carcase. Measurements taken at other quartering sites such as the 4th/5th rib or the 10th/11th rib are adjusted to the 12th/13th measurement. AUS-

MEAT assessed and Japanese digital image camera measured Eye Muscle Areas of carcasses contribute to this EBV. More positive EBVs indicate larger eye muscle area and therefore higher retail beef yields.

Rump Fat EBV (mm) estimates the genetic differences in fat depth at the P8 site of a 400kg carcase. AUS-MEAT measurements of P8 fat depth on carcasses contribute to this EBV. More positive EBVs indicate more subcutaneous fat and earlier maturity.

Marble Score EBV (AUS-MEAT Marble Score) estimates the genetic differences in Marble Score in a 400kg carcase. AUS-MEAT marble scores and Japanese digital image camera measured marbling percentage in carcasses contribute to this EBV. A higher value indicates that the animal has genes which produce higher marbling scores in the carcase.

Marble Fineness EBV (Marbling Fineness Index) is an estimate of the genetic difference in the Marbling Fineness Index (degree of fineness of marbling fat) as measured by the Japanese digital image camera. Sires with higher EBVs are expected to produce progeny with higher levels of marbling fineness.

Wagyu Fullblood Terminal Index

The Wagyu Fullblood Terminal Index (FTI) utilises the Carcase Weight EBV and the Marble Score EBV, being the traits which determine the price of Wagyu carcasses.

In producing the FTI and EBVs, AGBU has adjusted data to indicate the relative performance of every animal on a 'level playing field'. There are no inequalities or discrepancies resulting from variation in key production parameters such as Days on Feed (DOF) or Days of Age (DOA) at slaughter.

The assumptions are a 420kg carcase, a base price of \$8.50/kg carcase weight (a value of \$8.50/kg carcase weight is used as the current price of a carcase with a marble score of 7) and an increase/decrease in value of the carcase of \$1 per kilogram per marbling score. It is

assumed that only half of the difference in EBVs will be passed on to the progeny because only half the genes come from the sire.

If a sire has a Carcase Weight EBV of 0 and a Marble Score EBV of +0.0 it will have an Index of zero.

If a sire has a carcase weight EBV of +20 and a Marble Score EBV of +2.0 the value of the additional 10kg of carcase weight is \$85 (10kg @ \$8.50) and the value of one additional marble score is \$430 (430kg @ \$1). The sire will have an Index of +\$515 (\$85 + \$430). The sire will add \$515 to the value of its progeny on average compared to a sire with a zero Index.

If a sire has a carcase weight EBV of -20 and a Marble Score EBV of -2.0 the reduction in value due to the reduced carcase weight will be -\$85 (-10kg @ \$8.50) and the reduction in value of the one less marble score will be -\$410 (410kg @ \$1) It will have an Index of -\$495 (-\$85 -\$410) The value of the progeny of this sire will be on average \$495 less than a sire with a zero Index.

Additional EBVs available

The full set of Wagyu EBVs is available in the Australian Wagyu Association website www.wagyu.org.au - Animal Search - EBV Enquiry. These include:

Fertility and Birth EBVs

Scrotal Size EBV (cm) is an indicator of male fertility in regards to semen quality and quantity. Higher (positive) EBVs indicate higher fertility. There is also a small negative correlation with age of puberty in female progeny.

Gestation Length EBV (days) is based on AI records. Lower (negative) GL EBVs indicate shorter gestation lengths which generally relate to easier calving and increased growth after birth.

Birth Weight EBV (kg) is based on the measured birth weight of animals, adjusted for dam age. The lower the value the lighter the calf at birth and the lower the likelihood of a difficult birth. This is particularly important when selecting sires for use over heifers

Growth EBVs

200-Day Milk EBV (kg) is an estimate of an animal's milking ability. For sires, this EBV is indicative of their daughter's milking ability as it affects the 200-day weight of their calves.

200-Day Growth EBV (kg) is calculated from the weight of animals taken between 80 and 300 days of age.

Values are adjusted to 200 days and for dam age. This EBV is the best single estimate of an animal's genetic merit for growth to early ages.

400-Day Weight EBV (kg) is calculated from the weight of progeny taken between 301 and 500 days of age, adjusted to 400 days and for dam age. This EBV is the best single estimate of an animal's genetic merit for yearling weight.

600-Day Weight EBV (kg) is calculated from the weight of progeny taken between 501 and 900 days of age, adjusted to 600 days and for dam age. This EBV is the best single estimate of an animal's genetic merit for growth beyond yearling age.

Additional Carcase EBVs

Rib Fat EBV (mm) estimates the genetic differences in fat depth at the 12/13th rib in a 400kg dressed carcass. More positive EBVs indicate more subcutaneous fat and earlier maturity. AUS-MEAT Rib Fat measurements from slaughter animals contribute to this EBV.

Retail Beef Yield Percent EBV (%) This represents total (boned out) meat yield as a percentage of a 400kg dressed carcass. A more positive EBV indicates higher percentage yield for the 400kg carcass weight.

Disclaimer

The Estimated Breeding Values for Carcase Weight and Eye Muscle Area contained in this Sire Summary were compiled by the Agricultural Business Research Institute (ABRI) from data supplied by the breeder. Neither the Society nor the ABRI oversee or audit the collection of this data.

The Estimated Breeding Values for Marble Score and Marbling Fineness were calculated by the Animal Genetics and Breeding Unit from measurements taken on carcasses as part of the Wagyu Genetics Collaboration Research Project by staff skilled in the use of the Japanese digital camera.

The carcass data analysed by the Animal Genetics and Breeding Unit was predominantly from Fullblood feeders but also included crossbred animals ranging from F1 to Purebred. Dams were not identified for some progeny.

How to Use the New Wagyu Carcass EBVs & Fullblood Terminal Index to Breed for Commercial Production Targets

Example 1: Mating decision to achieve 470kg carcasses while maximising AUS-MEAT Marble Score.

Macquarie Wagyu (BDW) is used for this worked example and their assistance is appreciated.

Step 1

Select the best **females** from within the herd by using the Animal Search - EBV Enquiry search facility on the AWA website www.wagyu.org.au inserting the criteria: Current Owner Identifier is BDW, Select If – Animal is Female, minimum Carcass Weight EBV of 0 and minimum Marble Score EBV of 0. Sort on Fullblood Terminal Index. This will list the top candidate females.

Step 2

Select the best **sires** from within the herd by using the EBV Enquiry search facility on the web using the criteria: Current Owner Identifier is BDW, animal is a sire, minimum Carcass Weight EBV of 0 and minimum Marble Score EBV of 0. Sort on Fullblood Terminal Index. This will list the top candidate sires owned by this herd. Also list any AI sires available to the herd using the same criteria.

Step 3

Check for inbreeding levels using the Mating Predictor. A maximum of 10 percent inbreeding is acceptable in most breeding programs.

Step 4

Mate one or more of the sires to the selected females ensuring that inbreeding levels are not above 10%

Example 2: Mating decision to achieve a very finely marbled 400kg Fullblood Carcass with a maximum of carcasses achieving an AUS-MEAT Marble Score of 9+

Mayura Station (ADB) is used for this worked example and their assistance is appreciated.

Step 1

Select the best **females** from within the herd by using the EBV search facility on the web using the criteria: Current Owner Identifier is ADB, animal is a female, minimum Marbling Fineness of 2.0, minimum Marbling Score EBV of 1.0 and minimum Carcass Weight EBV of

0. Sort on Marbling Fineness EBV. This will list the top candidate females.

Step 2

Select the best **sires** from within the herd by using the EBV search facility on the web using the criteria: Current Owner Identifier is ADB, animal is a sire, minimum Marbling Fineness of 2.0, minimum Marbling Score EBV of 1.0 and minimum Carcass Weight EBV of 0. Sort on Marbling Fineness EBV. This will list the top candidate sires owned by this herd. Also list any AI sires that are available to the herd using the same criteria.

Step 3

Check for inbreeding levels using the Mating Predictor. A maximum of 10 percent inbreeding is acceptable in most breeding programs.

Step 4

Mate one or more of the top sires to the selected females ensuring that inbreeding levels are not above 10 percent

Example 3: Selecting a sires for breeding Crossbred Wagyu F1 50% calves from Angus females and achieving 450kg carcasses while maximising AUS-MEAT Marble Score.

Westholme Wagyu (AAC) is used for this worked example and their assistance is appreciated.

Step 1

Select the best **sires** from within the herd by using the EBV search facility on the web using the criteria: Current Owner Identifier is AAC, animal is a sire, minimum Marbling Score EBV of 0 and minimum Carcass Weight EBV of -10. Sort on Fullblood Terminal Index. This will list the top candidate sires.

Notes

1. The new carcass EBVs and Fullblood Terminal Index are available only for sires which have had carcass data submitted on progeny or grand progeny and the accuracy of the new EBVs is greater than 30%. Members will need to check which sires are available by AI from the AI sire list in this Wagyu Breeding Guide or from the Semen Catalogue on the website.
2. The new carcass EBVs and Fullblood Terminal Index are available only for dams which have had carcass data submitted on progeny or grand progeny and the accuracy of the new EBVs is greater than 30%.

Major Wagyu Prefectural Bloodlines

There are five traditional Japanese Black prefectural bloodlines, and one modern strain, of which at most four are represented in Australia, although formal local measurement of strain representation has not been undertaken. Combinations of all lines are used for fullblood meat production.

HYOGO PREFECTURE:

This is the home of Kobe Beef. The most common and well known Hyogo sub-strain in Australia is Tajima, but Kumanami is represented in the sire Itoshigenami, also frequently described as Tajima outside Japan. Hyogo or Tajima cattle are generally smaller framed with slower growth rates, but excellent meat quality. They are considered ideal outcross sires in the production of Crossbred Wagyu F1 50% feeder cattle. This is the most commoditised strain of Black Wagyu both in Australia and Japan. Careful infusion of Hyogo genetics is generally regarded as essential in the efficient production of the best quality Wagyu beef. Due to high levels of inbreeding, care is needed in joining Hyogo cattle within the same prefectural strain.

ITOZAKURA LINE:

The second most common grouping in Australia, this is a modern bloodline founded on the famous sire Dai 7 Itozakura, combining Hyogo and Okayama prefectural genetics (in Shimane Prefecture). Many seedstock of Takeda Farm breeding fall within this grouping and the founding sire is prominent in many Australian pedigrees. Kitaguni 7/8 is a sire example. The line is sometimes mis-described as Fujiyoshi, which is an Okayama prefecture line represented here by TF Mitsuhiokura.

SHIMANE PREFECTURE:

Probable third highest local representation, also often described as Fujiyoshi, this lightly represented group consists of medium framed cattle with good maternal qualities, growth rates and meat quality. TF39 Kinto is a sire example with about 46% Shimane.

TOTTORI PREFECTURE:

This prefecture is lightly represented in Australia through the Westholme fullblood herd. The two main strains are Kedaka and Eikou. Tottori supplied the dominant strains in Japanese Wagyu production during the 1960-1980s, with larger animals featuring straight, strong back lines, good growth rates, superior maternal ability and high yielding, high quality carcasses. It remains the second most influential strain in Japanese breeding. Itomoritaka, Hirashigetayasu and Shigefuku are local sire examples, with dam examples in the Westholme group.

JAPANESE BROWN:

Known as 'red' lines (Akaushi), Kochi and Kumamoto in Australia, have been strongly influenced by Korean and European breeds, particularly Simmental.

Michifuku - Tajima strain

TF Mitsuhiokura - Okayama prefecture line

Our Key Technology Partner in the Creation of New Generation Wagyu Genetic Analysis

In undertaking complex scientific programs such as the Wagyu Collaborative Genetics Research Project, the Australian Wagyu Association is dependent for advice and contractual implementation on globally recognised expert service providers. In this case, our internationally acclaimed partner is the Animal Genetics and Breeding Unit (AGBU) at the University of New England, Armidale, NSW. Following is some of the AGBU story....

The AGBU Story

The Animal Genetics and Breeding Unit was established in 1976 by the New South Wales State Department of Agriculture and the University of New England to carry out research, development and training in the genetic improvement of livestock for the benefit of Australian agriculture. From a small beginning of two scientists, one extension specialist and one secretary, under the leadership of Dr Keith Hammond it has grown to a team of 20 scientists, postgraduate students and support staff. It has an excellent international reputation and as a consequence, an active program of visiting scientists. The Director of AGBU is Dr Robert Banks.

AGBU's achievements include:

- BREEDPLAN, PIGBLUP and OVIS genetic evaluation systems which have been widely adopted by the beef, pig and sheep industries, respectively;
- BreedObject Software to calculate economic weights and selection indices tailored to individual requirements;
- Recognition as a leader in methods for the prediction of breeding values through these genetic evaluation systems;
- Major contributions to the Beef CRC programs;
- New knowledge of the genetics of growth, carcass and fertility traits in beef cattle and pigs;
- New methods for the estimation of genetic parameters;
- New methods for segregation analysis with and without genetic markers;
- Regular short courses for students and scientists in work related areas.

These achievements have been made possible by grants from all major livestock R&D funding bodies in particular Meat & Livestock Australia and Australian Pork Limited and the ongoing support of UNE and NSW Department of Primary Industries.

AGBU's work has greatly assisted the improvement of livestock through breeding in Australia and overseas. A vibrant scientific program continues with regular publication of research results in Scientific Journals. However, its main purpose is to meet ongoing demand from Australia's livestock industry for research, development and training in genetics.

Membership Delivers Real Value

The Australian Wagyu Association aims to deliver tangible commercial value to all its members. Become a member through www.wagyu.org.au – Membership.

Full Membership

Designed to be the highest membership category, offering all benefits provided by the association. These members are focused on highest quality seedstock cattle breeding and commercial beef production. They register their Wagyu Fullblood and Purebred cattle in the Wagyu Herdbook. They may also register Wagyu related cattle in the Wagyu Crossbred Register for grading up purposes or live export; and the Wagyu Commercial Register for slaughter cattle.

Registration of Wagyu cattle is not mandatory but adds very considerable value to those cattle.

COST: \$275 pa (inc GST) or A\$400 for overseas members.

Full Member Benefits Include:

Genetic improvement

- Participation in Wagyu BREEDPLAN (no additional cost for BREEDPLAN enrolment and performance data input)
- Discounted fees for DNA typing, parent verification, and genetic condition testing at the University of Queensland Animal Genetics Laboratory
- Participation in GenProb recessive genetic analysis
- Specialised reports through the members' only area on the AWA website
- Participation in research and development projects.

Marketing

- Recording Wagyu and Crossbred Wagyu cattle and their performance data in the Herd Book. Crossbred and Wagyu Commercial Registers maintained by the association provides very significant commercial value.
- Export certification of semen and embryos (service fee of \$75/animal)

- Minimum 20% discounted member rates for advertising in The Australian Wagyu Update. Assuming a full page advertisement at a member rate of \$665 saves \$242
- Advertising in the AWA website with a link from the AWA website to a member's website. Assuming a one year advertisement at a member rate of \$730 saves \$146
- Advertising through the AWA member email network. Assuming one advertisement per year at a member rate of \$165 saves \$33
- Advertising in the AWA Wagyu eNews. Assuming a one year advertisement at a member rate of \$1100 saves \$220

Herdbook registration (parent verified)

- The Herdbook is recognised internationally, enabling both domestic and export marketing of Herdbook registered livestock and their semen and embryos
- Herdbook dam premium (300+%). Estimated by the commercial value of Wagyu females being in the order of \$1000. Their Herdbook value is in the order of \$3000+
- Herdbook bull premium (190+%). Estimated by non-registered Wagyu bulls at 12 months of age valued in the order of \$1750 (meat value: \$5.00 * 350kg = \$1750), while their Herdbook bull value is in the order of \$5000+

Wagyu commercial registered (non parent verified)

- Commercially registered steer or female premium (10%). Estimated by non-registered Wagyu steers 12 months of age being valued at \$1575 (meat value \$4.50 * 350kg live = \$1575), while Commercial Registered value is in the order of \$1750 (meat value \$5.00 * 350kg live = \$1750)
- Export certification of live animals through ILRIC/ACGEA (service fee of \$25/head applies). 50% premium for Crossbred Wagyu (estimated by Angus heifers 300kg \$600 each, Crossbred Wagyu F1 50% 300kg \$950), 130% premium for Fullblood/Purebred (estimated by Angus heifers 300kg \$600 each, Wagyu Fullblood 100% 300kg \$1400+)
